From: <w6ids@...>
Topic: 1 Message: 1

Yep, this is a really quiet forum. What did I see. . . .five members?
Well, let me say hello to the crowd and open the windows for some fresh air.

I'm going to find out about the Mini-SB, I just placed an order for one and got back the shipping acknowledgement this morning. All I need to do now is pick out a whip, a SS spring and do some planning for mobile ops.

If this antenna system does as well as the reviews I've read the past couple of days, I will be enjoying HF mobile for the first time in, maybe, 20-plus years or so.

I'm going to install the Mini-SB in a 2005 Chevy Silverado PU. The HF rig? That's to be determined yet - but at least I've taken the first step and hope that I "did good."

Location is Richmond, IN on the IN/OH border, about 35 miles West of Dayton, OH.

Regards,

Howard W6IDS

Hi Howard ,thought I was the only member ;-)) nice to hear you ,I'm sure you will like the coil,I have brought the full size silver bullet and was so pleased with the quality and ease of use I ordered the wire silver bullet but takes about 3 weeks to get to uk in fact I'm expecting it today,
On the silver bullet I put the MFJ 1979 whip on too so can tune all band and pull out to required length,it's about the only good thing mfj make as it's stainless and good quality ,have fun with your new coil and let me know how you get on with it

Well, I received my coil. It looks like it’s well made. I’ve seen pix where there is a 4” SS spring (or similar size?) on the bottom of the coil. That’s better than a spring on the top? Just wondering. . . . .

Can you use the MFJ whip while in motion mobile? I had been looking for a 76” SS whip myself until I saw your comment.

Yes they are well made Howard I was impressed with quality,I found the spring didn't take too much motion before it bent over but try it may not be so windy in your neck of the woods as here,I can't see problem with 76inch whip mobile,good luck,I had my other coil delivered Saturday the one with 20 foot wire so will have play with that this week on 6 metre fishing pole

6. Amazing results on 14 foot vertical

Yahoo group: wolfrivercoils
Date: 2014-02-01 02:08:56 UTC
From: silkeep@sbcglobal.net
Topic: 6 Message: 6

I'm really glad I found the silver bullet 1000 coil. I use it to fashion an elevated 14 foot vertical on an old iron clothes line pole in the back yard. A home built resonator on the top of the coil puts it on 160 meters and am able to tune the entire band adjusting the coil for about 15 kc bandwidth. Shorting the coil out allows tuning 80-10 meters.

Sorry Barrie, no top hat is used in my home brew set up. I use the high quality MFJ 12 foot telescopic stainless steel whip. Is yours the 17 foot? The resonator coil is a crude PVC tube type coil made with the appropriate ends to screw on to the silver bullet and wound with 18 gage stranded automotive wire. The lower "Q" let's me more easily tune the 160 band with my LDG auto tuner. I run 200 watts and regularly reach 100 to 300 miles depending on band conditions and the other persons more efficient antenna. There is a shorting wire across the coil joined by automotive spade connectors so that the antenna can be tuned on the other bands. This may have a slight top hat effect. My back yard is small, has no trees and too close to high power utility lines to put up a proper antenna, but I have a lot fun talking to many different folks.

Hi Dan,yes mine is the 17 foot mfj I must admit good quality for mfj standards,well your set up sound good and works good,I'm afraid I wouldn't have a clue how to make the resonator you use,no trees this end either Dan so have just got flag pole and also got the silver bullet HV wire antenna with the 20 foot wire so will try that out when our weather gets bit better and let you know how it works

Topic: 6 Message: 10

The resonator is not that difficult. The reasoning behind it is to get a non metallic plumbing tube about a foot long, put some adapter hardware on each end cap and wind the appropriate inductance. The tube I used was about 2 1/4" outer diameter and the space was filled up with windings between the end caps plus a few more windings on top of those.
 Barrie, because you are using the 17 foot radiator I would guess your antenna would require about 130 uH of coil to resonate it to 160 meters. My antenna uses about 150 uH using the 12 foot radiator. If a top hat were used then the inductance would have to be lower making the coil less resistive and more efficient.
You are right about the weather. I would like to try some more variations but it will have to wait for the warmer weather.
I would like to try the bullet that uses the 20 foot wire as well. Real fun stuff!

11. Portable Vertical.

From: <popespcworks@...>
Topic: 11 Message: 11

Hello all,

I purchased the Wolf River Portable vertical a while back. Been doing some testing on it to be ready to use it as a field day antenna. Works well with 3 radials as Gary has said. My problem is that its very easily tuned 12-40m. But 80 is not even close. I can even get it to work on 10 with my internal tuner. I am using a rigexpert AA-30 analyzer and getting no lower than 4:1 swr on 80. My radio is a ICOM 746 non pro. This radio cuts back power at 1.5:1 . And even if I use my external tuner there is very little static on the band. I know I have at least an s5 noise level on my other antennas so its not even close to tuned. Would adding more radials help?

Mark - W7MCP,

A comment on ability of the Wolfe River Coil to operate effectively on 75 meters. First - my background. I have been a professional Auditor for years and years. Because of that I tend to have a keen sense of weaknesses and solutions. I must say that the product works like a charm, for me, on 75 meters in my mobile configuration. I run a large ball and spring mount molted through the trunk lid of our car with the coil on top of that and a 102" stainless steel whip on top of that. The antenna tunes to literally a flat 1:1 SWR on my required frequencies of 3.921 MHz and 3.967 MHz. I routinely work the UP Net and the Wisconsin State ARES Net. Both nets have reported, at different times, that my signal performance at 100 watts from my Yaesu FT 857d has improved noticeably from that of using HamStick style antennas also tuned as low as I could tune them with my MFJ antenna analyzer.

The bottom-line? I believe if you provide an adequate counterpoise you should be able to tune the antenna as required. I have operated nearly every ham radio band available for 8 years and have never had to use a tuner. I was Elmered that you tune your antenna and not your tuner for maximum system efficiency. The Wolfe River Coil helps me do that quite nicely on 75 meters with my MFJ Antenna Analyzer and a little patience. Have you tried a number of ground radials tune to 80 meters? More tuned radials are better for most, but not all antennas. I run a Gap Challenger DX antenna at home and am told that performance does not improve appreciably with more than three ground radials. I am very happy with the performance of the antenna by the way.

Hi Mark. . . .

Interesting read.

I am working on my mobile install – cold weather slowed me down a bit. I have the Mini-Silver Bullet and a 76” whip. The initial testing in my Chevy Silverado 2005 looked good down to 40 meters.

Where would the good location be for a spring – below the coil or above it?

Hi Howard,

Jon or Gary would be the guys to give you that answer I think. Im just a newby stumbling around with one of Gary's new portable vertical antennas. I have read nothing but good reviews on the Silver Bullet used in a mobile setup so I'm sure it will work great. My issue with 75/80 meter was solved today with the addition of 2 more radials. As I type this I am on 3.916 with multiple signals way above 10 db over 9. And my tuner is shut off. Transmit is about 1.3:1. Good enough for me. Every setup and ground condition is different. I must have needed a better ground.

16. Alpha Antennas

Yahoo group: wolfrivercoils
Date: 2014-05-20 16:52:24 UTC
From: hoegolfs@...
Topic: 16 Message: 16

Wolfrivercoils has partnered with Alphaantennas.com to make a portable antenna. Alpha has been producing portable antenna systems over 15 years. Alpha has produced a line of portable antennas using our coil. Please go to there website and look at there products and the alpha line using our coil. Gary

17. 5 new photo,s??

Yahoo group: wolfrivercoils

From: popespcworks@...
Topic: 19 Message: 19

For our club Field Day I was tasked to do an HF setup in the local park. Most of the local club are 2M operators so that's why I was given this task. I took out the Wolf River Portable Vertical and had it set up in about 15 minutes. Usually I can have it set up quicker than that but the SWR for 20M was being a bit flaky. In other locations I have used it I have had no problems at all. I blame the soil. Very dry and rocky for a park. I do use 3 radials with mine all the time. Once I got it resonant it worked great. My fellow club hams were amazed at how simple it was to change bands and how many contacts we made over the day.

Good job Gary. As I have said before great antenna for field work.

MarK/W7MCP

Having never uploaded a photo to anywhere. . .is the method
fairly intuitive or are there some unique instructions?

I’ve got a couple of my Wolfe/mobile install in my ‘05 Silverado.

Thanks Mark just curious how many contacts. We also setup for field day 4 antenna on 15 20 and 80 using 102 inch whips. On 40 we used the Silver Bullet rotatable dipole. New item we been testing for the last year will be for sale soon. All antennas worked great. Will post photos. Thanks for using our antenna and glad you had a good field day. Gary

I just reviewed the log and we had 297 contacts starting on 20 at the opening bell and finishing on 80 at 10:00 p.m Saturday night when they kicked us out of the park.lol. Only Dx we were able to log was 5 stations on 15 in Hawaii (I think that's Dx anyway) and a couple Canadian stations. All in all a very productive day for a club that doesn't have much interest in hf.

I might add that though the antenna performes well on 20. 40 is where it most definitely shines. With the help of geographic location also. At greyline we tuned it up for 40 and put a fresh operator behind the Mic (he never worked a contest btw) and threw out our club call. Wow! From never working a contest to a pileup that quick. I is something to see. Great fun!

Well, if it works for you, then by George, I rest my case <GRIN>. Just tried the link thingie at the bottom again on two computers with either Chrome or IE. Got the same result. Not a problem for me, though. Keywords work wonders and there's no problem finding a way to find you.

Heh Heh. . . .Wolfe River Coils, you can't hide, no matter what. We're gonna find you.

BTW, love my Mini Bullet. Works really well with my Kenwood pre-owned TS-120. Got a couple of pictures to take of the install tomorrow when sun is up and then put them up for viewing.

One thing I might mention is that my own Bullet coil "sleeve" doesn't move as smoothly as shown in the You Tube videos. It's a bit tight (the lock screw is loose) and adjusts but it's stiff/jerky sort of. Works fine otherwise, I'm just sayin'. . .

Glad I purchased it, all things considered.

Let me add that I'm typing this message while in the groups Yahoo forum.
I could not get there via the Group's link at the bottom of the message,
nor could I get here via the link at the Wolfe River's page. Numerous tries
resulted in a failure to display the page.

So, I got here by logging onto Yahoo, going to My Groups, then selecting
on the wolfrivercoils link. For whatever reason, this is how it's now working
for ME.

Just sayin'. . . .

What are you unsubscribing from – that 404 Page thingie below? <GRIN>

There's a bit of an issue with the Yahoo group it seems to me. Just a minor one IMHO 'cause I purchased the coil and am totally enamored with it. I found other ways to get to the website as I posted earlier. Works for me for now <GRIN>.

There's a fix somewhere, so long as someone is able to determine the root cause for the inability to get to the forum through the link at the bottom of the message.

BTW, when you're in the company website, the link to the forum doesn't work for me either. Other folks have no problem it seems.

Just a thought here, Vic.

click on Visit Your Group link down below.

Then, when there, go the bottom and click on the link -

Silver Bullet Portable Vertical Base Antenna

There’s a You Tube video too. This might give you some food for thought.

Install against the balcony? Drop a radial wire? Or use the balcony as a radial?

Topic: 37 Message: 43

After some time trying to make contacts from the Apartment Balcony installation of the Silver Bullet MINI Coil, I have come to the conclusion that this set-up would be better suited for MOBILE / Field operation using SSB .

As you know JT65 is key-down 100% power during transmissions. The coils does get warm to dissipate the RF ..... Thus the antenna radiation signal was effected..... Not many connections , yes the antenna matched / tuned with low SWR but just did not produce contacts world wide.

My previous antenna the OPEK HVT 400B radiated very well, but wanted something to get on the WARC bands 17/12 meters..... thought the SB Mini coil was the answer. Thanks to GARY KB9Ait for all his help and suggestions.....It is probably a great system on the mobile for "County Hunting".

Always interested in playing with different antenna systems.....Now I have installed a Monoband HamStick type antenna and it radiates real well from the balcony.....So I need to get the collection of the other bands to complete having access to 20 15 17 12 10 bands.....

One just needs to keep trying until you have reasonable success. Over 70 countries on JT65 Mode in less that 2years from the balcony

Update on my experiment !!

44. Coil Use

Yahoo group: wolfrivercoils
Date: 2015-06-14 18:31:40 UTC
From: n2lrb@...
Topic: 44 Message: 44

I have a question about coil usage. When when going up the coil am I using more of the coil or less? At what point am I using the most amount of the coil, the bottom (where the coax is) or the top (where the antenna goes?

Using the Mini I find that 20 meters is toward the top of the coil when using a 9.5 inch telescoping whip.

From: vloewen2@...
Topic: 44 Message: 45

Jumper wire attached to bottom of coil (coax end) and the slider collar near bottom you use the most turns of the coil,,,,,,,,,,,,,Slider collar near the top you use LESS of the turns from the coil.

Yes 20 meters near the top whip end and 40 meters near the bottom end closer to the coax
.....

Hi Rick.

Yes I plan on using my Portable Vertical. I used it last year with very good results. Last year I did an HF demo for field day for our Local club here in Montpelier, Idaho. These guys are all 2M hams. So they were shocked at the results I had with it. It was set up in a park at about 5200 ft. Ran barefoot with an Icom 746.

This year I am doing my own thing. Going to camp in the local mountains at about 7100 ft. and run strictly battery with my Yaesu 857D and the portable vertical. I am fairly confident of the same results as last year, bands permitting .

I do run 3 radials with the vertical and use an antenna analyzer to speed up tuning. 20M is very easy but 40 can take a bit of tweaking. My system where the antenna has to be manually tuned for each band is to get tuned on say 20. Work all the stations i can hear then if I can find an open frequency call CQ (finding an open frequency by far the hardest part).. Then change bands. Retune and do it all over again.

Have a great field day.

Based upon your own field experience, what are you thoughts about using it in a permanent location, considering cost, ease of install, etc. Of course, it has the matter of band changing, but that said. . . . . .

Was just wondering. I use mine mobile but have wondered about putting another one into use in my home location, atop an 20 foot tall utility pole with three or four elevated radials. Use it for fixed frequency for my Winlink HF Gateway station on 7 Mhz in stead of a dipole.

I recall some articles in which it was shown that an elevated vertical could be really effective with only three radials or so. Much less than when in a grounded mounted configuration.

Howard,

Last summer I changed locations of my shack from one structure on my property to another. With my work schedule I was not able to get my ocf dipole and Mosley beam into service. Just to get on the air I set up the portable vertical with the 3 radials and had a lot of contacts that way. Obviously the other 2 antennas perform better. Especially the Mosley beam.

At this time the antenna and radials we're ground mounted. So, I can't comment on how it would perform in the air. My guess would be that it would work satisfactory for your needs. The Wolf River guys could answer your question better.

I know out of the antennas I have purchased the portable vertical has the most bang for the Buck and simplicity of setup. Side by side test with my Mosley showed only a 2 s unit difference in Rx. The Mosley did much better in Tx. But in all actuality they shouldn't be compared. The Mosley was almost $1000.

Hope you come up with a good solution. Wish I had better knowledge to help you out.

FWIW, I’m happy with MY Mini - Silver Bullet w/76” stainless.

Great mobile station, IMHO, with that antenna and a TS-130.
Many contacts on 7 Mhz and 14 Mhz. Worked into EU with
it on 14 Mhz not long ago – Greece and Poland. Surprised
them. Tried testing a Wouxun X1M mobile QRP too and it
worked great with a tuner.

Great product and price too! I just happened to stumble onto it
and after buying and using it, am really glad I did. Two years
now, I think, and no issues. Coil looks new too.

Glad to hear it worked well for you Rick. I used my Wolf River coils portable vertical for the 24hr period of the contest and did ok. Was not the antenna at fault but location. The mountains around my chosen campsite where just a little too high to get a signal out very good. An NVIS antenna would be more suited for that location.

I was able to, with a lot of work get 97 SSB contacts. Mostly 40 and 80 meter after dark. Nothing like last year but as I said beautiful location but poor for radio ops.

Hope to hear you on the bands.

Jose the coils are weather resistant snow, water, ect have little affect on the coils. I have run them in snow and rain with no problem operating HF in less than ideal conditions mobile. Wire is stainless steel and all hardware is stainless so no rust corrosion. Gary KB9AIT

For the FWIW Bucket, I've had MY mobile install running 2 1/2 years with the Mini-Bullet on a Silverado without any type of weathering issues at all. No added protection.

The coil is just as pretty as it was when I first installed it. Great product, very durable it
seems to me. I have seen no effects whatsoever from rain, road salting in Winter, road "grime", bug impacts (if at all), etc. VERY glad I made the purchase.

Subject: Re: [wolfrivercoils] Re: Weather Proof?

I oiled the coil with a rag and then slid an upside-down 2-liter soda bottle over it, after having cut out the bottom of the bottle.

Hi Rick,

How are you doing your tuning now?

Hey, thanks.

Was curious is all. I do the same thing and find it works just fine. I guess your reference to the analyzer need is what caught my attention.

For ME, the Silver Bullet and a 76” whip was as great purchase.

Tuning to the loudest never works for me. I tune in AM, cause I am trying to determine the SWR and that cannot be done while in SSB. So tuning for the loudest (even when I tried SSB) does not work. The audio is the same throughout.

Rick, Tuning depends on the antenna length and the environment you are in. I use 50 inch, 66 inch, 102 inch and 16.5 feet antennas and the tuning for each is different. Sometimes I forget to roll out the counterpoise and I will get it tuned, but not at the same point as with the counterpoise. I only use one counterpoise since it's the whip with the coil is out the window and the counterpoise is inside my bedroom. Out of doors I use more counterpoises.(radials).

It also tunes differently if I am using it at my regular location or out of doors, like in a park. So I can leave it at my usual 20 meter setting like when I use it out my window, but in the park I have to change it to tune it. So it all depends on what you use and where you are.

Howard,

Pls enlighten me as to the type of mount you are using on your Chev Silverado and where you have it mounted.

I have a 2001 with a full cap on a 6ft box so there are no stake bed holes to access.

On a previous HF installation, on my old Nissan Frontier, the students at the welding school fabricated a mount and WELDED it to the chassis. It worked like gangbusters! This was using a screwdriver type HF antenna. I think the same thing would work well with the Silver Bullet, its just that I no longer teach at that school so I need to do the welding myself.....you'll probably read about that little project on the 11 o'clock news!!!

I replied off line with pictures. It occurred to me that perhaps you could use the same brackets I did with a suitable adaptable modification of some sort to fit your situation?

Hi all Rick again to do some more bragging I changed the whip from the 102" cb whip to a long adjustable whip I had with my buddi pole there again changed the tuning position as expected but It seams to have broadened the band width but that may just may be in my head I have used my silver bullet with my FT-817 -FT- 897 and now I am using my IC-703 and all with great results I have this as my main antenna sense I received it just before field day this is with out a doubt the best portable antenna I have ever used .
hope to see you all the air
Rick

Rick that all depends on the length of the antenna, your counter-poises(s) and location as metalic objects and structure do affect the swr. The best you can do is see where the coil setting are for a particular antenna length in a particular location.

Best

Hello everyone:
I have uploaded several pictures of our new dipole antenna. We call it the Odophone. It consists of a aluminum base
Set at a angle and supports two coils. The whips can be collapsible or 102 inch stainless steel whips. Look for it on our website soon. Will offer it as a kit with collapsible whips or just the base or base and two coils. Odophone is designed to work as a portable dipole using collapsible whips or permanent installation using 102 inch whips. Thanks for your support.
